

Supplemental Figure 2. Changes in serum predialysis B2MG levels, clearance of small molecules, and TMP during the study period. (A) Serum predialysis B2MG level (p for intergroup difference = 0.02). (B) Kt/V urea (p for intergroup difference = 0.33). (C) TMP (p for intergroup difference = 0.001). The gray line indicates predilution HDF, and the black line indicates mixed-HDF. HDF, hemodiafiltration; B2MG, β 2-microglobulin; TMP, transmembrane pressure.
