

Supplementary Figure 1. Kaplan-Meier curves for graft survival of kidney allografts according to the donor-recipient *MYH9* genotype, excluding primary non-function. Kaplan-Meier curves for 15-year death-censored graft survival after kidney transplantation were reanalyzed after excluding donor and recipient kidney transplant pairs with primary non-function (PNF). The incidence of graft loss among the groups was compared using the Log-rank test. *MYH9*, myosin heavy chain 9 gene; SNP single-nucleotide polymorphism.
