

Supplementary Figure 2. Kaplan-Meier curves for graft survival of kidney allografts transplanted before 2001 and after 2000 according to the donor-recipient *MYH9* genotype. Cumulative 15-year death-censored kidney graft survival is shown according to the presence of the *MYH9* polymorphism (rs11089788 C>A) in donor-recipient pairs transplanted (A) before 2001 and (B) after 2000. Pairs were divided into two groups according to the presence of the AA-genotype in the both the recipient and donor (green line) was compared to the rest (black line). Log-rank test was used to compare the incidence of graft loss between the groups. *MYH9*, myosin heavy chain 9 gene; SNP single-nucleotide polymorphism.
