

Supplementary Fig. 2. Bland-Altman plot for sex-specific agreement between current and new eGFR equations. (A) eGFR based on creatinine in men, (B) eGFR based on creatinine in women, (C) eGFR based on creatinine and cystatin C in men, and (D) eGFR based on creatinine and cystatin C in women. The average of two eGFRs (x-axis) is plotted against the difference of two eGFRs (y-axis). Difference was calculated as new eGFR – current eGFR. Solid horizontal lines represent means and dashed lines represent standard deviations of eGFR differences.

eGFR, estimated glomerular filtration rate.
